

## GAIA TEAM

Humanity is going through a deep growth crisis accelerated by technological change, by Global Warming, by overpopulation, by ecological variations, and by the potential for a hostile alien intrusion before the end of the present 21st century.

It is necessary to bring together the best human resources to ask the right questions and obtain the correct answers desired, to be able to embark on the path from darkness to light and carry out the transformation of society and technological civilization in harmony, peace and well-being for

all .

Under this premise, the Gaia Team summons renowned thinkers, scientists and qualified humanists to elaborate a Master Plan to save the Planet and a new Social Contract with a view to the XXII Century, which includes the development of a Type I civilization, with a language universal, global government, global direct digital democracy, International Council of Sciences, Planetary Army, minimum life annuity to the entire population to face the replacement of work by robotics and AI, abolition of extreme poverty worldwide, stop Global Warming and decontaminate and ensure peace on all continents.

What it is about is the establishment of key strategies to be able to solve each systemic and global crisis that affects us one by one, providing governments with the necessary Know How to be able to tackle them at an effective cost.

The Gaia Team is an initiative that consists of bringing together the wise men of the Earth to work as a team to provide feasible and operational solutions that renew hope.

With the favorable vote of 3 stable members, you can join the group.

The way of working consists of the exchange of e-mails between the participants, adding their opinions and observations on the topics presented in debate. Then a summary and a final report will be prepared that will be uploaded in the form of a book, which will initially be translated into 9 languages. The conclusions will provide a guide for the management of global crises, which the

politicians of each country will be able to apply in their respective governments.

It is an effort of goodwill. All the participants of the Gaia Team are asked to work and collaborate in the task to help Humanity in crisis, for a few weeks, in order to jointly develop a Master Plan to Save the Planet that is logical, feasible and effective.

As a starting point for the debate, the IPCC reports and the books “WORLD E-GOVERNMENT-2% for the Planet: Solution to Global Warming” and “CASANDRA EFFECT: Analysis of the arctic“ Methane Bomb ”are proposed: Consultation without response to scientists about an abrupt retroaction of clathrate release in 2025/30 ”.

A Master Plan to Save the Planet must say what to do and also how to do it. In this sense, the first priority is financing. Without capital intensive for a long time there will be no long-term solutions. It is necessary to apply between 2 to 3% of world GDP annually to solve the triple scourge of hunger, overpopulation and global warming.

Once the nations of the world decide to allocate vital funds, the issue is in which programs to apply them, how to do it, for how long and how to control the administration of funds so that there is no corruption in the system.

The second most important point is to proceed with the immediate planting of 30 billion kiri trees per year, and then cut down their trunks and bury them, in order to capture CO<sub>2</sub> and return it to the subsoil.

The third point is how to coordinate all the necessary actions.

For this, a Planetary Eco Government system is proposed, centralizing the decision-making capacity. This supranational structure would be controlled by a form of Global Direct Digital Democracy, advised by a Council of Sciences, made up of scientists from all nations.

The fourth point is to limit overpopulation (one child per family), which is what accelerates pollution and consumption. The planet only supports 5,000 million inhabitants. And if we consider non-renewable resources in the long term, the number drops to 1 billion. The planet has finite resources, it does not support overpopulation with exponential growth.

It has been 40 years since the talk of Global Warming began, why was nothing effective done until now? Because the system of economic and political organization that we have does not allow it. If we want to save the planet, we must change the system of social, economic and political organization, integrating a new supranational scale. Go straight to a Type I technological pre-civilization.

Now, the problem we all have is the little time we have left to act preventively. In 2030, it will reach 450 ppm of CO<sub>2</sub> in the atmosphere. The Arctic Ocean will completely thaw in summers and overheat. This will allow the huge underwater methane gas hydrate reservoirs to be released. An explosive chain reaction will occur. And it is possible that the phenomenon will be activated earlier, between 2025 to 2030, when the floating ice of the North Pole has been reduced to 75%.

Determining the time of this event horizon is the job of

scientists. It is something that is urgent to do. We are all at risk and there is insufficient awareness of the problem.
