

HOW MUCH TIME DO WE HAVE ? : 4 YEARS MAXIMUM

A study by the World Meteorological Organization (WMO) predicts that at least one year in 2021-25, with a probability of 90%, will be the warmest of the century with temperatures between 0.9 and 1.8 degrees Celsius. That is, it will reach the floor of 1.5 degrees and it will even exceed...

Before 2030, 450 ppm of CO₂ will be reached and the global average temperature will increase to 2 degrees Celsius. The floating ice of the North Pole will thaw and the process of releasing the huge deposits of methane gas hydrates will begin. Then abruptly the temperature may jump up to 6/8 ° more.

Our time is up, the situation requires the application of immediate corrective measures under penalty of dealing with the worst consequences of accelerating climate change.

What measures to implement ?: Ban individual combustion cars in all cities of the world, cut the electricity supply after 8:00 p.m., reduce the operation of thermoelectric plants, reduce 80% flights by plane, prohibit tourism, reduce consumption to a minimum, reduce meat intake and replace it with vegetables, stop tree felling and move to planting 30 billion new trees per year, invest intensive capital in the development of fusion reactors, avoid travel , limit overpopulation by authorizing only one child per family. And before the emergency, apply a comprehensive reengineering of the world's social, economic and political organization system, adding a coordinating supranational structure: the Planetary Eco Government, controlled by a system of Direct Digital Democracy, advised by a Council of Sciences, integrated by scientists from all continents. And above all, allocate sufficient funds of intensive capital to attend the global climate emergency in critical phase. Already the speeches of environmental politicians, of climate scientists with their graphics, have gone to hell, they have been devoured by the new reality of the catastrophe in process.

How to save time: Microsoft founder funds the Controlled Stratospheric Disturbance Experiment (SCoPEX). It is about the possibility of emptying into the atmosphere tons of non-toxic calcium carbonate dust that allows to attenuate sunlight and thus cool the planet. This would allow the global temperature to be reduced by 1.5°. He would demand the use of thousands of airplanes at a cost of 10 billion dollars per year. Extra time would be gained to implement emergency measures to mitigate and slow Global Warming.

How did we get into this situation?

+ Overpopulation = + Intensive crops = + More energy consumption = + Industrial Production = + Pollution = + Global Warming

Global warming has enough potential to cause a global death toll 100 times higher than the coronavirus pandemic, if we do nothing to stop it. Let's wake up to action now and stop this tragedy.

The percentage of the activists of Friday For Future regarding the overpopulation of almost 8 billion inhabitants is 0.1% ... With this level of indifference and irresponsibility we are going down a direct slide to disaster. It is urgent that the common citizen be informed and participate. Everyone knows about Global Warming, but they ignore how fast it is accelerating and how big it will be.
